TANK TIP No.4

It is always good practice to collect rain water from multiple points rather than just the one. If you are only collecting from the one point, you could maximise the flow by restricting the flow to the other downpipes.

How much rain water will I collect?

Every sq metre of catchment per millimetre of rain will yield one litre.
Eg: Roof area is 9mtrs x 15mtrs = 135mtrs and the rain gauge 25mm. Rain water collected would be 135 x 25 = 3375 litres (742 gallons).

Been 'round for years
