**TANK TIP
6**

The coolest water in your tank is away from the side wall. Before installing your new tank, extend the outlet inside the tank to the centre where the water is cooler. All you need is a piece of poly pipe with an external thread into the outlet. A 50mm (2") outlet has a 40mm (1½") internal thread.

For yard taps, have an extra outlet fitted to the tank and by the same procedure install a riser vertically up 300-400mm inside the tank. This will ensure you don't lose all your water if a hose or tap is left on or unattended.

Been 'round for years
